

AI in my daily life

1. Navigation System

Being the personal “Uber driver” of my family, and my love for driving, in general, makes me appreciate the existence of Navigation systems that are able to calculate the fastest/shortest routes.

Advantages

- Travel time estimation
- Shortest route calculation
- Real time traffic prediction and route modification based on that

Navigation systems helped me to escape the highway traffic by predicting the traffic situation ahead and suggesting a different route, many times.

Disadvantages

- The access to your location/search data
- Inaccurate routes

The inaccurate routes issue is probably the most discussed disadvantage of navigation systems, which I personally experienced too. As much as I like the navigation system idea, I personally try to not rely on it heavily. The access to the locations and destinations is another disadvantage. Only the companies that stand behind the navigation systems, know how they will use your data.

2.Shopping recommendations

Advantage	Disadvantage
Seamless shopping experience	Data tracking

As much as I care about my privacy and try to limit the data trucking, I still find myself using google for online shoppings. Their recommendations AI provides relevant recommendations, which makes the overall process easy and efficient.
